

AI Copilot Usage Log (Curated)

Unit: NIT2112 Object Oriented Programming

Project: OzZoo GUI

Session date: 2026-04-10

Generated: 2026-04-10 21:36:51

This document is curated evidence of meaningful AI assistance. It highlights key prompts, representative AI output snippets, and the reason each prompt was used.

Key Prompt 1: Gameplay expansion: add Kookaburra + Platypus as playable mission species

Category: Design idea + code generation

Prompt

I like kookaburras and platypus. add these animal classes, making them playable. I also noticed the starter animal

AI Output Snippet

```
class Kookaburra(Bird):
    def __init__(self, name: str, age: int, gender: str = "unknown") -> None:
        super().__init__(name, age, species="Kookaburra", wingspan=0.65, can_fly=True, gender=gender)

_animal_types = {
    "platypus": Platypus,
    "kookaburra": Kookaburra,
}

animal_names = {
    "Kookaburra": ["Kookie", "Kev", "Kerry", "Kayla", "Kai"],
    "Platypus": ["Perry", "Paddles", "Pearl", "Phoenix", "Pip"],
}
```

Analysis

I used this prompt to add missing species content and ensure those species actually participate in core gameplay loops (factory creation, mission generation, and starter setup). Naming was included so the Animal frame shows individual identities instead of generic placeholders.

Key Prompt 2: Mission progress logic fix (required_days vs target_value)

Category: Debugging + correctness

Prompt

Fix the mission progress bar so it updates correctly when a day advances. The bug is that get_progress_percentage(

AI Output Snippet

```
def get_progress_percentage(self) -> float:
    if self.mission_type == MissionType.KEEP_HAPPY:
        required_days = int(
            self.custom_data.get(
                "required_days",
                getattr(self, "required_days", self.target_value),
            )
        )
        return min(100.0, (self.current_progress / required_days) * 100)

def update_progress(self, amount: int) -> None:
    if self.mission_type != MissionType.KEEP_HAPPY:
        if self.current_progress >= self.target_value:
            self.is_complete = True
```

Analysis

I used this prompt to target a specific logic mismatch: animal count and day streak are different dimensions. The fix ensures KEEP_HAPPY progress and completion are both evaluated against required_days, not target_value.

Key Prompt 3: Heal button crash fix (Medicine mapping type)

Category: Runtime debugging

Prompt

When using the heal button... `TypeError: Medicine(**med_data) argument after ** must be a mapping, not Medicine`

AI Output Snippet

```
def _heal_animal(self, animal: Animal) -> None:
    from ...models.resources import MEDICINE_TYPES
    med_key = self._find_available_medicine(animal)
    ...
    # MEDICINE_TYPES contains Medicine objects directly
    medicine = MEDICINE_TYPES[med_key]
    healing = medicine.apply(animal)
```

Analysis

I used this prompt to resolve a concrete crash from the traceback. The issue was a wrong assumption about data shape; `MEDICINE_TYPES` already stores `Medicine` instances, so unpacking with `**` was invalid.

Key Prompt 4: Mission widget visual feedback review

Category: UI debugging

Prompt

I need you to review all the python files relating to the progress bar because there is no visual feedback on the

AI Output Snippet

```
progress_pct = mission.get_progress_percentage()
bar = ttk.Progressbar(
    card,
    orient="horizontal",
    mode="determinate",
    maximum=100,
    value=progress_pct,
)
bar.pack(fill="x", pady=(3, 5))
```

Analysis

I used this prompt to verify the UI binding path end-to-end: model percentage -> widget value -> rendered bar. The key output confirms the mission widget is fed by `mission.get_progress_percentage()`.

Key Prompt 5: Day-advance ordering fix for KEEP_HAPPY registration

Category: Deep debugging + behavioural fix

Prompt

When I advance the day the Progress is still not being resistered even though the animals are happy for that day

AI Output Snippet

```
# Mission tracking phase 1 (KEEP_HAPPY only, before daily stat decay).
if self._active_missions:
    self.update_mission_progress(include_types={MissionType.KEEP_HAPPY})

# === MIDDAY ===
for animal in list(self._animals.values()):
    if animal.is_alive:
        animal.daily_update()

# Later completion check uses required_days for KEEP_HAPPY
if mission.current_progress >= required_days:
    mission.is_complete = True
```

Analysis

I used this prompt because the symptom suggested timing, not arithmetic. Progress was being evaluated after daily stat decay, so animals dropped below the happiness threshold before the mission check. Reordering fixed day progression feedback.

Key Prompt 6: Documentation deliverable prompt

Category: Documentation

Prompt

Create an AI Copilot Usage Log (PDF format) from this session. This is not just a transcript, but a curated log...

AI Output Snippet

Deliverable generated: AI_Copilot_Usage_Log_Session_2026-04-10_0zZoo_Curated.pdf

Includes: key prompts, AI output snippets, and brief analysis for each prompt.

Analysis

I used this prompt to convert coding work into assessment-ready evidence. The emphasis is on decision rationale and traceability of AI assistance, not just raw conversation history.
